1. **Implement a `Circle` class to calculate the area and circumference of a circle by taking input using an `input()` method.**

2. **Write a Java program to implement a `Circle` class that calculates the area and circumference of a circle by taking user input using the `Scanner` class.**

3. **Implement a `Circle` class to calculate the area and circumference of a circle using a non-parameterized constructor.**

4. **Implement a `Circle` class to calculate the area and circumference of a circle using a parameterized constructor.**

5. **Implement a `Circle` class to calculate the area and circumference of a circle using a parameterized constructor and the `this` keyword.**

6. **Write a Java program to implement a `Circle` class using a copy constructor to copy the radius of one circle object to another and calculate their area and circumference.**

7. **Implement a `Circle` class using a static variable to count the number of objects created.**

8. **Write a Java program to demonstrate the use of a static method in a `Circle` class to display the number of objects created.**

9. **Implement a `Circle` class to calculate the area and circumference of a circle and count the number of objects created using a static variable.**

10. **Implement a `Circle` class to create multiple objects, calculate the area and circumference of each circle, and display the total number of objects created using static members.**
